It's wrong. The configure scripts just uses some pattern like:

```
gcc -V;  
if [ $? = 0 ]; then  
    echo "gcc supports -V";  
else  
    echo "gcc does not support -V";  
fi
```

If you export SHELLOPTS, then "set -e" will be passed to the shell process running configure and make it stop at "gcc -V".

Don't export SHELLOPTS.
